Northstar Laboratory Knowledge Base Test

1. Project Overview

Northstar Laboratory is an equipment reservation and management platform for university research teams. Its main laboratory is located at 156 Wenchang West Road, Hanjiang District, Yangzhou. The platform entered pilot operation in June 2026 and serves materials science, robotics, and artificial intelligence research groups.

2. Equipment Information

The robotics area has six collaborative robot arms: four RX-7 units and two RX-12 units. Only members who have completed safety training and obtained Level-2 permission may reserve an RX-12. The scanning electron microscope is under scheduled maintenance every Tuesday afternoon and cannot be reserved during that period.

3. Reservation Rules

Standard equipment can be reserved up to seven days in advance. Each member may reserve no more than two time slots per day, and each slot lasts two hours. High-value equipment requires supervisor approval. If a user does not check in two hours before a reservation begins, the system automatically releases the slot.

4. Incident Handling

When equipment fails, the user must stop operation immediately and submit a fault ticket through the platform. For an emergency involving personal safety, call the laboratory duty number 0514-8899-6600 before submitting a ticket.

> **Suggested test questions:** Where is Northstar Laboratory located? What permission is required for an RX-12 reservation? When is the scanning electron microscope maintained? When is an unattended reservation released? What must be done first during a safety emergency?
